

# UNIT II Query processing and decomposition

# Query Processing Objectives

- ▶ – Minimize response time
- ▶ – Reduce communication cost
- ▶ – Efficient resource utilization
- ▶ – Improve throughput and scalability
- ▶ – Maintain correctness and consistency

# Characterization of Query Processors

- ▶ – Query parsing
- ▶ – Query validation
- ▶ – Query transformation
- ▶ – Query optimization
- ▶ – Query execution

# Layers of Query Processing

- ▶ 1. User Interface Layer
- ▶ 2. Query Decomposition Layer
- ▶ 3. Data Localization Layer
- ▶ 4. Global Optimization Layer
- ▶ 5. Local Optimization & Execution Layer

# Query Decomposition

- ▶ – Parsing and semantic analysis
- ▶ – Query normalization
- ▶ – Query rewriting
- ▶ – Generation of relational algebra expressions

# Localization of Distributed Data

- ▶ – Mapping global queries to local fragments
- ▶ – Fragment identification
- ▶ – Data allocation awareness
- ▶ – Reconstruction of distributed relations

# Query Optimization

- ▶ – Selection of efficient execution plans
- ▶ – Cost estimation
- ▶ – Join ordering
- ▶ – Access path selection

your roots to success...

# Centralized Query Optimization

- ▶ – Single-site database environment
- ▶ – Cost-based optimization
- ▶ – Heuristic optimization
- ▶ – Join optimization techniques

# Distributed Query Optimization

- ▶ – Multiple-site execution planning
- ▶ – Communication cost consideration
- ▶ – Data transfer minimization
- ▶ – Parallel execution strategies

# Distributed Query Optimization Algorithms

- ▶ – Dynamic Programming
- ▶ – Greedy Algorithms
- ▶ – Branch and Bound
- ▶ – Heuristic-based Optimization
- ▶ – Semi-Join Strategies

# Advantages & Challenges

- ▶ Advantages:
  - ▶ – Better performance
  - ▶ – Scalability
- ▶ Challenges:
  - ▶ – Network overhead
  - ▶ – Complex cost estimation
  - ▶ – Data distribution management

# Conclusion

- ▶ Query decomposition and optimization are essential for efficient distributed database query execution.
