

# UNIT-III

# Transaction Management

# Transaction Management – Definition

- ▶ A transaction is a logical unit of work that consists of one or more database operations executed as a single unit.

# Properties of Transactions (ACID)

- ▶ Atomicity
- ▶ Consistency
- ▶ Isolation
- ▶ Durability

# Types of Transactions

- ▶ Read-only Transactions
- ▶ Read-Write Transactions
- ▶ Distributed Transactions
- ▶ Nested Transactions
- ▶ Long-duration Transactions

# Distributed Concurrency Control

- ▶ Ensures correctness of concurrent transactions in distributed databases while maintaining consistency and isolation.

# Serializability

- ▶ A schedule is serializable if its outcome is equivalent to some serial execution of transactions.
- ▶ Types:
  - ▶ – Conflict Serializability
  - ▶ – View Serializability

# Concurrency Control Mechanisms

- ▶ Lock-based Protocols
- ▶ Timestamp-based Protocols
- ▶ Optimistic Protocols
- ▶ Multiversion Concurrency Control

# Lock-Based Algorithms

- ▶ Binary Locks
- ▶ Shared/Exclusive Locks
- ▶ Two-Phase Locking (2PL)
- ▶ Strict 2PL

# Timestamp-Based Concurrency Control

- ▶ Each transaction receives a unique timestamp.
- ▶ Operations are executed according to timestamp order.

# Timestamp Ordering Algorithm

- ▶ Read Timestamp (RTS)
- ▶ Write Timestamp (WTS)
- ▶ Validation of read/write requests using timestamps.

# Optimistic Concurrency Control

- ▶ Assumes conflicts are rare.
- ▶ Phases:
  - ▶ 1. Read Phase
  - ▶ 2. Validation Phase
  - ▶ 3. Write Phase

# Optimistic Concurrency Control Algorithm

- ▶ Transactions execute without locking.
- ▶ Validation checks conflicts before commit.
- ▶ Rollback occurs if validation fails.

# Deadlock Management

- ▶ Deadlock occurs when transactions wait indefinitely for each other's resources.

# Deadlock Prevention

- ▶ Wait–Die Scheme
- ▶ Wound–Wait Scheme
- ▶ Resource Ordering

# Deadlock Detection & Recovery

- ▶ Wait-for Graph
- ▶ Cycle Detection
- ▶ Transaction Rollback
- ▶ Resource Preemption

# Advantages and Challenges

- ▶ Advantages:
  - ▶ – Improved consistency
  - ▶ – Better resource sharing
- ▶ Challenges:
  - ▶ – Communication overhead
  - ▶ – Deadlock handling
  - ▶ – Synchronization complexity

# Conclusion

- ▶ Transaction management and concurrency control ensure reliable, consistent, and efficient distributed database operations.
